## A Mighty Fortress Revealed

Since he and his team began excavating the ancient Egyptian colony of Tombos in Sudanese Nubia, [Stuart Tyson Smith](#) has made a host of discoveries. But something eluded the UC Santa Barbara professor of [anthropology](#): evidence of the fortifications typical of a settlement on the frontier.

No longer. In a chapter of a new book, "[From Microcosm to Macrocosm: Individual households and cities in Ancient Egypt and Nubia](#)" (Sidestone Press, 2018) Smith and his co-author, Michele Buzon, a professor of anthropology at Purdue University, detail their discovery of the foundations of a fortress at Tombos that likely dates to the colony's founding around 1450 BC.

The discovery of massive fortifications — 400 meters a side — helps cement Tombos' place as an important Egyptian colony of the New Kingdom (c. 1550-1070 BC), said Smith, who has excavated the site in Sudan with Buzon since 2000.

"Karo was a lost fortress — nobody knew exactly where it was and the likely candidates all had other names," Smith said. "Once we started excavating in the cemetery people started speculating that it might be at Tombos, but there was no sign of a fort. It was puzzling, because it didn't fit the bill; it was explicitly called a fortress, so it had to be fortified. Once we found a fortification, I went, 'Aha! Here's the smoking gun that lets us know that this is the place mentioned by the Vizier Merymose over 3,300 years ago at the edge of the colonized zone of Nubia.'" "

In “The Fortified Settlement at Tombos and Egyptian Colonial Strategy in New Kingdom Nubia,” Smith and Buzon write that the first hints of a fortress at Tombos date to the first years of the 16<sup>th</sup> century BC, when the pharaoh Thutmose I conquered Kush and incorporated Nubia into an empire that would last through the end of the New Kingdom.

Not long after, Thutmose I ordered inscriptions carved on granite outcrops at Tombos, which Smith and others have argued signified an internal boundary within Egypt’s Nubian empire at the headwaters of the Third Cataract. Interpreters of the inscription have said it refers to the construction of a *menenu*, or fortress, at the site — although no fortification had been found.

Fast-forward more than 3,500 years. Beginning in 2013 and continuing through the 2015-17 field seasons at Tombos, Smith and Buzon discovered evidence of buildings and what they termed “a massive new fortification.” Distinctive pottery types, inscriptions and radiocarbon dates indicate that it was built around 50 years after the conquest, probably commissioned under the joint reign of Queen Hatshepsut and her stepson Thutmose III (c. 1578-1458 BC).

“One of our goals was to find the town where people were living,” Smith said. “We knew it was somewhere under the (modern) village because we’ve seen pottery and we’ve done a couple of little tests and found some foundations in one spot, a bunch of pottery in other places. And so we decided to go all in and just start digging in every open space the villagers would let us dig in. And they were very nice about it, which I have to say is typical of the Nubian people who have been our hosts all these years.

“Initially, we found this weird feature,” he continued. “It looked like a subterranean building of some kind.” Below ground, it was a trench lined with mud brick walls and had mud floors on a stone foundation. It was also filled with “heaps and heaps of pottery, so there were a lot of people living nearby.”

Smith and Buzon weren’t sure what it was, but in the next two seasons they kept following it in both directions. They dug a number of test trenches to see how far it went through the village. “It just kept going and going,” said Smith, noting it ran far past the southern edge of the modern village and out to the Nile to the west, a span of more than 200 meters to a side. It is, he said, larger than any of the other fortified colonies going back to the Middle Kingdom (c. 2050-1710 BC).

Why such a big fortress at Tombos? Buttressing the newly discovered importance of the site, Smith said, was the earlier discovery of an elaborate tomb for an Egyptian official named Siamun. Originally arrayed across the façade of the tomb were funereal cones referring to him as “scribe-reckoner of the gold of Kush.”

Smith said he suspects Siamun was in charge of the annual payment of tribute to the pharaoh, likely gold as his title suggests, but also other products like cattle, ivory and ebony. He described it as taxation framed as reciprocity: provide for the king and he'll assure your safety. It's a common practice across cultures, Smith noted, one typically described as ritualized tribute framed as a kind of gift exchange.

Although the empire's formal boundary lay far upstream near the Fifth Cataract of the Nile, Tombos' location on the east bank of the Nile at the Third Cataract and its massive fortifications, Smith said, would have made it a powerful symbol of the kingdom's power and influence at a symbolic internal boundary within the empire, only 10 kilometers north of the conquered capital at Kerma. Downstream the Egyptians inserted a series of fortified colonies like Tombos, but upstream they adopted a more hands-off policy, allowing a degree of local autonomy.

Smith estimates the fortress was an active defensive structure for 100-200 years, after which the trench begins to fill with trash. Why? The answer may lie in what he calls the “cultural entanglement” — the process by which colonizing powers and indigenous people influence one another and change over time — of Egypt and Nubia.

Smith and Buzon's work in the cemetery just outside Tombos has provided strong evidence of such close integration between the Egyptian colonizers and their Nubian subjects that their cultural entanglement led to a blurring of cultural identities. With that, Smith suspects, the threat from Nubia — and the need for a great fortress — would have evaporated in the desert heat.

“It's quite possible that later on,” Smith said, “Egyptian control of Nubia was so strong, and Nubia was so well integrated into the empire, and more broadly Egyptian society, that in fact the need for fortifications disappears, at least on the east bank at Tombos, since the New Kingdom colonies to the north, all located on the west bank, still maintained fortifications. Of course, it's also possible they built another one and we haven't found it.”

Looking ahead, Smith said he wants to search for the temple and houses that would have been a part of the fortress. Tombos, it turns out, is the gift that keeps on giving.

“Oh, it is,” he said. “It’s amazing, and I went into it initially thinking, ‘Oh, it’s maybe a five-year excavation campaign; we’ll figure out what’s going on here and then move on to something else.’ But we just kept finding more and more.”

Smith and Buzon’s work in Tombos have been supported by grants from the National Science Foundation and the National Geographic Society.

## **About UC Santa Barbara**

The University of California, Santa Barbara is a leading research institution that also provides a comprehensive liberal arts learning experience. Our academic community of faculty, students, and staff is characterized by a culture of interdisciplinary collaboration that is responsive to the needs of our multicultural and global society. All of this takes place within a living and learning environment like no other, as we draw inspiration from the beauty and resources of our extraordinary location at the edge of the Pacific Ocean.
